

# CASTROL CAREMAX™ WATER TEST KIT

IT'S MORE THAN JUST OIL.

**Marine**

# A SIMPLE WAY TO MEASURE WATER CONTAMINATION

**Onboard ships, water is one of the most common causes of lubricant contamination.**

The Castrol CAREMAX™ Water Test Kit is a 'pressure cell type' piece of equipment with the level of water contamination indicated on an easy to read dial.

Testing for water in oil is essential to maintain and protect equipment, preventing damage. Water contamination can be caused by leakage, condensation and malfunction of purifiers. Unchecked, water in oil will cause corrosion, instability of lubricant additive packages and encourage the growth of microbes. Ultimately, it can lead to machinery failure, downtime and significant costs.

The use of the Castrol CAREMAX™ Onboard Water Test Kit allows lubricating oils to be checked quickly and accurately for the presence of water. This allows close monitoring of critical or particularly vulnerable items of machinery and equipment to help to reduce downtime and failure.
